

The Helping Hand

Our drone has plenty to offer to teachers or just anyone that is busy that needs to start something up. But mainly for the teachers it is helpful because it can be sent out and start the laminator while the teacher has to teach it'll let them know when it is ready so they won't forget and they can use it instantly. I believe it can be used for more than that, maybe like preheating the oven while you are away or connecting to your Irobot and helping it decide where to clean next. You could possibly even allow it to adjust temperatures in the house. The options are unlimited. You can have the helping hand actually be something you use daily. Since it is a drone you can also use a regular controller and have some fun with it. The motors are definitely powerful so it will let you have some fun especially in the outdoors. Now I know there are companies who have tech that is built into houses and things like that but who would want something they can use for work and use for fun and bring it out to fly it is just more fun that way and especially when you can only use the home technology at home it is just spending your money just because at that point. Get you a helping hand!
